# A note on the first eigenvalue of spherically symmetric manifolds

Cleon S. Barroso G. Pacelli Bessa\* February 2, 2008

#### Abstract

We give lower and upper bounds for the first eigenvalue of geodesic balls in spherically symmetric manifolds. These lower and upper bounds are  $C^0$ -dependent on the metric coefficients. It gives better lower bounds for the first eigenvalue of spherical caps than those from Betz-Camera-Gzyl.

Mathematics Subject Classification: (2000):35P15, 58C40. Key words: spherically symmetric manifolds, first Laplacian eigenvalue.

### 1 introduction

Let  $B_{\mathbb{N}^n(\kappa)}(r)$  be a geodesic ball of radius r > 0 in the simply connected n-dimensional space form  $\mathbb{N}^n(\kappa)$  of constant sectional curvature  $\kappa$  and let  $\lambda_1(B_{\mathbb{N}^n(\kappa)}(r))$  be its first Laplacian eigenvalue, i.e. the smallest real number  $\lambda = \lambda_1(B_{\mathbb{N}^n(\kappa)}(r))$  for which there exists a function, called a first eigenfunction,  $u \in C^2(B_{\mathbb{N}^n(\kappa)}(r)) \cap C^0(\overline{B_{\mathbb{N}^n(\kappa)}(r)}) \setminus \{0\}$ , satisfying  $\Delta u + \lambda u = 0$  in  $B_{\mathbb{N}^n(\kappa)}(r)$  with  $u|\partial B_{\mathbb{N}^n(\kappa)}(r) = 0$ . In the case  $\kappa = 0$ , it is well known that  $\lambda_1(B_{\mathbb{R}^n}(r)) = (c(n)/r)^2$ , where c(n) is the first zero of the Bessel function  $J_{n/2-1}$ . In the case  $\kappa = -1$ , there are fairly

<sup>\*</sup>Research partially supported by CNPq-Brasil

good lower and upper bounds for  $\lambda_1(B_{\mathbb{H}^n}(r))$ . For instance, one has the upper bounds

$$\sqrt{\lambda_1(B_{\mathbb{H}^n}(r))} \le (n-1)(\coth(r/2)-1)/2 + [(n-1)^2/4 + 4\pi^2/r^2 + (n-1)^2(\coth(r/2)-1)^2/4]^{1/2}.$$

See [6], page 49 and see [9] for sharper upper bounds. Moreover, one has the lower bound,

$$\sqrt{\lambda_1(B_{\mathbb{H}^n}(r))} \ge \frac{(n-1)\coth(r)}{2}$$
.

See [12]. This lower bound was improved by Bessa and Montenegro in [4] to

$$\sqrt{\lambda(r,n)} \ge \max\left\{\frac{n}{2r}, \frac{(n-1)\coth(r)}{2}\right\}.$$
(1)

The case c=1 is more delicate. Although the sphere is a well studied manifold, the values of the first Laplacian eigenvalue  $\lambda_1(B_{\mathbb{S}^n}(r))$ , (Dirichlet boundary data if  $r < \pi$ ) are pretty much unknown, with the exceptions  $\lambda_1(B_{\mathbb{S}^n}(\pi/2)) = n$ ,  $\lambda_1(B_{\mathbb{S}^n}(\pi)) = 0$ . In dimension two and three there are good lower bounds due to Barbosa-DoCarmo [1], Pinsky [10], Sato [11] and Friedland-Hayman [8]. In higher dimension, the lower bounds known (to the best of our knowledge) are the following lower bounds due to Betz, Camera and Gzyl obtained in [5] via probabilistic methods.

$$\left(\frac{c(n)}{r}\right)^2 > \lambda_1(B_{\mathbb{S}^n}(r)) \ge \frac{1}{\int_0^r \left[\frac{1}{\sin^{n-1}(\sigma)} \cdot \int_0^\sigma \sin^{n-1}(s) ds\right] d\sigma} \cdot (2)$$

The upper bound is due to Cheng's eigenvalue comparison theorem [7] since the Ricci curvature of the sphere is positive (in fact, it needed only to be non-negative).

In order to state our result let us recall the definition of a spherically symmetric manifold. Let M be a Riemannian manifold and a point  $p \in M$ . For each vector  $\xi \in T_pM$ , let  $\gamma_{\xi}$  be the unique geodesic satisfying  $\gamma_{\xi}(0) = p$ ,  $\gamma'_{\xi}(0) = \xi$  and  $d(\xi) = \sup\{t > 0 : t \in S_p\}$ 

 $\operatorname{dist}_{M}(p, \gamma_{\xi}(t)) = t$ }. Let  $\mathcal{D}_{p} = \{t \, \xi \in T_{p}M : 0 \leq t < d(\xi), |\xi| = 1\}$  be the largest open subset of  $T_{p}M$  such that for any  $\xi \in \mathcal{D}_{p}$  the geodesic  $\gamma_{\xi}(t) = \exp_{p}(t \, \xi)$  minimizes the distance from p to  $\gamma_{\xi}(t)$  for all  $t \in [0, d(\xi)]$ . The cut locus of p is the set  $\operatorname{Cut}(p) = \{\exp_{p}(d(\xi) \, \xi), \, \xi \in T_{p}M, |\xi| = 1\}$  and  $M = \exp_{p}(\mathcal{D}_{p}) \cup \operatorname{Cut}(p)$ .

The exponential map  $\exp_p : \mathcal{D}_p \to \exp_p(\mathcal{D}_p)$  is a diffeomorphism and is called the geodesic coordinates of  $M \setminus \operatorname{Cut}(p)$ . Fix a vector  $\xi \in T_pM$ ,  $|\xi| = 1$  and denote by  $\xi^{\perp}$  the orthogonal complement of  $\{\mathbb{R}\xi\}$  in  $T_pM$  and let  $\tau_t : T_pM \to T_{\exp_p(t\xi)}M$  be the parallel translation along  $\gamma_{\xi}$ . Define the path of linear transformations

$$\mathcal{A}(t,\xi):\xi^{\perp}\to\xi^{\perp}$$

by

$$\mathcal{A}(t,\xi)\eta = (\tau_t)^{-1}Y(t)$$

where Y(t) is the Jacobi field along  $\gamma_{\xi}$  determined by the initial data Y(0) = 0,  $(\nabla_{\gamma'_{\xi}} Y)(0) = \eta$ . Define the map

$$\mathcal{R}(t): \xi^{\perp} \to \xi^{\perp}$$

by

$$\mathcal{R}(t)\eta = (\tau_t)^{-1} R(\gamma'_{\xi}(t), \tau_t \eta) \gamma'_{\xi}(t),$$

where R is the Riemann curvature tensor of M. It turns out that the map  $\mathcal{R}(t)$  is a self adjoint map and the path of linear transformations  $\mathcal{A}(t,\xi)$  satisfies the Jacobi equation  $\mathcal{A}'' + \mathcal{R}\mathcal{A} = 0$  with initial conditions  $\mathcal{A}(0,\xi) = 0$ ,  $\mathcal{A}'(0,\xi) = I$ . On the set  $\exp_p(\mathcal{D}_p)$  the Riemannian metric of M can be expressed by

$$ds^{2}(\exp_{p}(t\,\xi)) = dt^{2} + |\mathcal{A}(t,\xi)d\xi|^{2}.$$
(3)

**Definition 1.1** A manifold M is said to be spherically symmetric if the matrix  $\mathcal{A}(t,\xi) = f(t)I$ , for a function  $f \in C^2([0,R])$ ,  $R \in (0,\infty]$  with f(0) = 0, f'(0) = 1, f|(0,R) > 0.

The class of spherically symmetric manifolds includes the canonical space forms  $\mathbb{R}^n$ ,  $\mathbb{S}^n(1)$  and  $\mathbb{H}^n(-1)$ . The *n*-volume V(r) of a geodesic

ball  $B_M(r)$  of radius r in a spherically symmetric manifold is given by  $V(r) = w_n \int_0^r f^{n-1}(s) ds$ , whereas the (n-1)-volume S(r) of the boundary  $\partial B_M(r)$  is given by  $S(r) = w_n f^{n-1}(r)$ . Here  $w_n$  denotes the (n-1)-volume of the sphere  $\mathbb{S}^{n-1}(1) \subset \mathbb{R}^n$ . The authors [2] obtained using fixed point methods the following lower bound for the first eigenvalue  $\lambda_1(B_M(r))$  of geodesic balls  $B_M(r)$  with radius r in a spherically symmetric manifold M,

$$\lambda_1(B_M(r)) \ge \frac{1}{\int_0^r \frac{V(\sigma)}{S(\sigma)} d\sigma}.$$
 (4)

It is worth mentioning that this lower bound (4) is Betz-Camera-Gzyl's lower bound when  $M = \mathbb{S}^n$ . The purpose of this note is give upper and better lower bounds for  $\lambda_1(B_M(r))$ . We prove the following theorem.

**Theorem 1.2** Let  $B_M(r) \subset M$  be a ball in a spherically symmetric Riemannian manifold with metric  $dt^2 + f^2(t)d\theta^2$ , where  $f \in C^2([0, R])$  with f(0) = 0, f'(0) = 1, f(t) > 0 for all  $t \in (0, R]$ . For every nonnegative function  $u \in C^0([0, r])$  set

$$h(t,u) = \left[ u(t) / \int_{t}^{r} \int_{0}^{\sigma} \left( \frac{f(s)}{f(\sigma)} \right)^{n-1} u(s) ds d\sigma \right].$$

Then

$$\sup_{t} h(t, u) \ge \lambda_1(B_M(r)) \ge \inf_{t} h(t, u) \tag{5}$$

Equality if (5) if and only if u is a first positive eigenfunction of  $B_M(r)$  and  $\lambda_1(B_M(r)) = h(t, u)$ .

In the following table we compare our estimates for  $\lambda_1(r) = \lambda_1(B_{\mathbb{S}^n}(r))$  for  $n = 2, 3, r = \pi/8, \pi/4, 3\pi/8, \pi/2, 5\pi/8$  taking  $u(t) = \cos(t\pi/2r)$  with the estimates obtained by Betz-Camera-Gzyl.

n=2/r	$\pi/8$	$\pi/4)$	$\pi/8$	$\pi/2$	$5\pi/8$
$BCG/\lambda_1(r)$	$\geq 25.77$	$\geq 6.31$	$\geq 2.70$	$\geq 1.44$	$\geq 0.85$
$BB/\lambda_1(r)$	$\geq 35.85$	$\geq 8.78$	$\geq 3.76$	=2	$\geq 1.01$
n = 3/r	$\pi/8$	$\pi/4$	$3\pi/8$	$\pi/2$	$5\pi/8$
$n = 3/r$ $BCG/\lambda_1(r)$	$\frac{\pi/8}{\geq 38.50}$	$\frac{\pi/4}{\geq 9.31}$	$3\pi/8$ $\geq 3.90$	$\begin{array}{ c c c c c c }\hline \pi/2\\ \geq 2\\ \end{array}$	$5\pi/8$ $\geq 1.10$

### 2 Proof of Theorem 1.2

We start recalling the following theorem due to J. Barta.

**Theorem 2.1 (Barta, [3])** Let  $\Omega \subset M$  be a bounded domain with piecewise smooth boundary  $\partial \Omega$  in a Riemannian manifold. For any  $f \in C^2(\Omega) \cap C^0(\overline{\Omega})$  with  $f|\Omega > 0$  and  $f|\partial \Omega = 0$  one has that

$$\sup_{M} (-\triangle f/f) \ge \lambda_1(\Omega) \ge \inf_{\Omega} (-\triangle f/f). \tag{6}$$

Equality in (6) holds if and only if f is a first eigenfunction of  $\Omega$ . The lower bound inequality needs only that  $f|\Omega > 0$ .

Let  $u \in C^0([0,r])$ ,  $u \geq 0$ . Define a function  $T(u) \in C^1([0,r])$  by  $T(u)(t) = \int_t^t \int_0^{\sigma} (f(s)/f(\sigma))^{n-1} u(s) ds d\sigma$ . Extend u and Tu radially to  $B_M(r)$  by  $\tilde{u}(\exp_p(t\eta)) = u(t)$  and  $\tilde{T}(u)(\exp_p(t\eta)) = T(u)(t)$ , for  $\eta \in \mathbb{S}^{n-1}$ . Observe that  $\tilde{T}(u)(\exp_p(t\eta)) \geq 0$ , with  $\tilde{T}(u)(\exp_p(t\eta)) = 0$  if and only if t = r. We have that

$$\Delta \tilde{T}u(\exp_p(t\,\eta)) = -\tilde{u}(\exp_p(t\,\eta)) \tag{7}$$

as a straight forward computation shows. Applying Barta's Theorem we obtain that

$$\sup_{t} \frac{u}{T(u)}(t) \ge \lambda_1(B(r)) \ge \inf_{t} \frac{u}{T(u)}(t).$$

Barta's Theorem says that equality in (7) holds if and only if  $\tilde{T}(u)$  is a first eigenfunction. Thus we need only to show that  $\tilde{T}(u)$  is a first eigenfunction if and only if u is a first eigenfunction. Suppose that we have equality in (7) then  $\tilde{T}(u)$  is an eigenfunction, this is

$$0 = \Delta \tilde{T}u + \lambda_1(B_M(r))\tilde{T}u = -\tilde{u} + \lambda_1(B_M(r))\tilde{T}u \tag{8}$$

Applying the Laplacian in both side of the equation (8) we obtain by equation (7) that

$$0 = -\Delta \tilde{u} + \lambda_1(B_M(r))\Delta \tilde{T}u = -(\Delta \tilde{u} + \lambda_1(B_M(r))\tilde{u})$$
 (9)

Therefore u is a first eigenfunction with  $\lambda_1(B_M(r)) = \frac{u}{T(u)}$ .
